

Key Facts and State Symbols

Governor	Charles Duane “Charlie” Baker, Jr. (R)
Lieutenant Governor	Karyn Ellen Polito (R)
U.S. Senators	Elizabeth Ann Warren (D) Edward John Markey (D)
State Capital	Boston
Date of Statehood	February 6, 1788 (6th state)
Before Statehood	Province of Massachusetts Bay
State Nicknames	The Bay State; The Old Colony State; The Codfish State
Largest City	Boston
Highest Point	Mount Greylock (3,489 feet)
Demonym	Bay Stater (official); Massachusettsite (traditional)
Lowest Point	Atlantic Ocean (sea level)
Time Zone	Eastern
Artist	Norman Rockwell
Bean	Baked Navy Bean
Berry	Cranberry (<i>Vaccinium macrocarpon</i>)
Beverage	Cranberry Juice
Bird	Chickadee (<i>Penthestes atricapillus</i>)
Blues Artist	Henry St. Clair Fredericks, better known as Taj Mahal
Building & Monument Stone	Granite
Cat	Tabby Cat (<i>Felis familiaris</i>)
Ceremonial March	“The Road to Boston,” composer unknown
Children’s Author and Illustrator	Theodor Geisel, better known as Dr. Seuss
Children’s Book	<i>Make Way for Ducklings</i> , by Robert McCloskey
Colors	Blue, Green, and Cranberry
Cookie	Chocolate Chip Cookie
Dessert	Boston Cream Pie
District Tartan	Bay State Tartan
Dog	Boston Terrier (<i>Canis familiaris bostenensis</i>)
Donut	Boston Cream Donut
Explorer Rock	Dighton Rock
Fish	Atlantic Cod (<i>Gadus morrhua</i>)
Flower	Mayflower (<i>Epigaea repens</i>)
Folk Dance	Square Dance
Folk Hero	Johnny Appleseed, born John Chapman in 1774
Folk Song	“Massachusetts,” words and music by Arlo Guthrie
Fossil	Dinosaur Track
Game Bird	Wild Turkey (<i>Meleagris gallopavo</i>)
Gem	Rhodonite
Glacial Rock	“Rolling Rock” (a balanced glacial boulder located in Fall River, MA)
Glee Club Song	“The Great State of Massachusetts,” words by George A. Wells, music by J. Earl Bley
Hero	Samuel Whittemore
Heroine	Deborah Samson
Historical Rock	Plymouth Rock
Horse	Morgan Horse (<i>Equus caballus morganensis</i>)
Insect	Lady Bug (<i>Coccinella magnifica</i>)
Inventor	Benjamin Franklin
Korean War Memorial	Charlestown Navy Yard Korean War Memorial

Weather Elements (NWS Stations Only)

The following elements were taken directly from the International Station Meteorological Climate Summary. The periods of records vary per station and are noted at the bottom of each table.

Maximum precipitation, minimum precipitation, maximum snowfall, maximum snow depth, maximum 24-hour snowfall, thunderstorm days, foggy days, relative humidity (morning and afternoon), dewpoint, prevailing wind speed and direction, and maximum wind gust are all self-explanatory.

The word trace appears for precipitation and snowfall amounts that are too small to measure.

Predominant sky cover contains four possible entries: CLR (clear); SCT (scattered); BRK (broken); and OVR (overcast).

Inclusion Criteria—How Stations Were Selected

The basic criteria is that a station must have data for temperature, precipitation, heating and cooling degree days of sufficient quantity in order to create a meaningful average. More specifically, the definition of sufficiency here has two parts. First, there must be 22 values for a given data element, and second, ten of the nineteen elements included in the table must pass this sufficiency test. For example, in regard to mean maximum temperature (the first element on every data table), a given station needs to have a value for every month of at least 22 of the last thirty years in order to meet the criteria, and, in addition, every station included must have at least ten of the nineteen elements with at least this minimal level of completeness in order to fulfill the criteria. We then removed stations that were geographically close together, giving preference to stations with better data quality.

Methodology

The following discussion applies only to data compiled from the NCDC DSI-3220 data tapes and excludes weather elements that are extreme maximums or minimums.

The data is based on an arithmetic average of all available data for a specific data element at a given station. For example, the average maximum daily high temperature during July for any given station was abstracted from NCDC source tapes for the thirty Julys, starting in July, 1980 and ending in July, 2009. These thirty figures were then summed and divided by thirty to produce an arithmetic average. As might be expected, there were not thirty values for every data element on every table. For a variety of reasons, NCDC data is sometimes incomplete. Thus the following standards were established.

For those data elements where there were 26-30 values, the data was taken to be essentially complete and an average was computed. For data elements where there were 22-25 values, the data was taken as being partly complete but still valid enough to use to compute an average. Such averages are shown in ***bold italic*** type to indicate that there was less than 26 values. For the few

data elements where there were not even 22 values, no average was computed and 'na' appears in the space. If any of the twelve months for a given data element reported a value of 'na', no annual average was computed and the annual average was reported as 'na' as well.

Thus the basic computational methodology used is designed to provide an arithmetic average. Because of this, such a pure arithmetic average is somewhat different from the special type of average (called a "normal") which NCDC procedures produces and appears in federal publications.

Perhaps the best outline of the contrasting normalization methodology is found in the following paragraph (which appears as part of an NCDC technical document titled, CLIM81 1961-1990 NORMALS TD-9641 prepared by Lewis France of NCDC in May, 1992):

Normals have been defined as the arithmetic mean of a climatological element computed over a long time period. International agreements eventually led to the decision that the appropriate time period would be three consecutive decades (Guttman, 1989). The data record should be consistent (have no changes in location, instruments, observation practices, etc.; these are identified here as "exposure changes") and have no missing values so a normal will reflect the actual average climatic conditions. If any significant exposure changes have occurred, the data record is said to be "inhomogeneous," and the normal may not reflect a true climatic average. Such data need to be adjusted to remove the nonclimatic inhomogeneities. The resulting (adjusted) record is then said to be "homogeneous." If no exposure changes have occurred at a station, the normal is calculated simply by averaging the appropriate 30 values from the 1961-1990 record.

In the main, there are two "inhomogeneities" that NCDC is correcting for with normalization: adjusting for variances in time of day of observation (at the so-called First Order stations data is based on midnight to midnight observation times and this practice is not necessarily followed at cooperative stations which are staffed by volunteers), and second, estimating data that is either missing or incongruent.

The editors had some concerns regarding the comparative results of the two methodologies. Would our methodology produce strikingly different results than NCDC's? To allay concerns, results of the two processes were compared for the time period normalized results are available (1971-2000). In short, what was found was that the answer to this question is no. Never the less, users should be aware that because of both the time period covered (1980-2009) and the methodology used, data is not compatible with data from other sources.

Potential Cautions

First, as with any statistical reference work of this type, users need to be aware of the source of the data. The information here comes from NOAA, and it is the most comprehensive and reliable core
